# Molecular Geometry and Spectroscopic Investigation on 2-Imino-5-Phenyl-4-Oxazolidinone Using Quantum Computational Methods 

D. Shoba ${ }^{a^{*}}$<br>S. Periandy ${ }^{\text {b }}$

#### Abstract

In this work, Fourier Transform Infrared Red and Fourier Transform RAMAN spectra were studied in the range of $4000-400 \mathrm{~cm}-1$ and $4000-100 \mathrm{~cm}^{-1}$ respectively, for 2-Imino-5-phenyl-4-oxazolidinone compound. The optimized molecular structural parameters, vibrational frequencies and corresponding vibrational intensity of the bands computed using Hartree-Fock and Density Functional Theory with B3LYP/ 6-311+G(d,p) method and basis sets and the result are interpreted. The results of the calculations were used to stimulated vibrational spectra of the title compound and the whole vibrational assignments of all the fundamentals were made, which show outstanding agreement with experimental spectra. The NMR chemical shifts for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ of the molecule were calculated by gauge independent atomic orbital with B3LYPmethod and $6-311+\mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set and the chemical shifts were compared. The frontier molecular orbital energies, UV-Visible wavelengths absorption, corresponding excitation energy, dipole moment were computed by HF and DFT Hartree-Fock and Density Functional Theory methods. The Entropy Enthalpy and heat capacity at different temperatures were computed. In addition, Mullikan charges and molecular electrostatic potential map performed.

Keywords: FTIR and FT-Raman B3LYP, GIAO, MEP, HOMO-LUMO.

## INTRODUCTION

The molecular formula for the 2-Imino-5-phenyl-4-oxazolidinone (abbreviated as 215 P 4 O ) is $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{2}$. The other name of the title molecule is

Pemoline, 2-Amino-5-phenyl-2-oxazolin-4-one. 215 P 4 O is a powdered white crystal, it is insoluble in water, melt at $245^{\circ} \mathrm{C} .2 \mathrm{I} 5 \mathrm{P} 4 \mathrm{O}$ is an oxazolidine compound. Central nervous system is stimulate by

[^0]215P4O and used in treatment of attention deficit and hyperactivity complaint and impulsivity in children as well as adults with narcolepsy in case of no response of psychotherapy. Amines derived from $\beta$-phenyl ethyl amines and their derivatives are found to be effective in central nervous system stimulation. They also can produce an increase in arterial blood pressure as well as appetite depressions.

Hence, literature survey reveals that, no such work has been reported on 2I5P4O, particularly the spectroscopic analysis such IR, Raman, UV, and NMR analysis were not carried out till now. Hence, the present investigation was undertaken to carry out all these spectral analysis with help of quantum computational theories through ab-initio and density functional methods.

## EXPERIMENTAL DETAILS

The FTIR, FT Raman and FT NMR spectra of the compound under investigation namely 215 P 4 O was bought from Spectral Library of M/S Aldrich Chemicals, USA. Affording to the report, the FTIR spectrum of the compound was recorded wave number ranging between 4000 and $400 \mathrm{~cm}^{-1}$ with perseverance of $\pm 2 \mathrm{~cm}^{-1}$ using Perkin-Elmer 180 Spectrometer. The FT-Raman spectrum of the compound was recorded using FRA 106 Raman module equipped with Nd: YAG laser source operating at $1.064 \mu \mathrm{~m}$ line widths with 200 mW powers with scanning speed of $30 \mathrm{~cm}^{-1} \mathrm{~min}^{-1}$ of spectral width $2 \mathrm{~cm}^{-1}$, wave number ranging between 4000 and $100 \mathrm{~cm}^{-1}$. The wave numbers of all piercing bands are precise to $\pm 1 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were noted using high perseverance Nuclear Magnetic Resonance Spectrometer[1].

## DETAILS OF COMPUTATION

The Gaussian 09 programing software is used to perform complete quantum chemical calculations $[2,3]$ on a Pentium IV/3.02GHz PC. The structure of the molecule 2I5P4O was designed using Gauss view program [4]. The same structure is used to get optimized structural parameter and compute the vibrational frequencies by Hartree-Fock and DFT(B3LYP) methods with basis set $6-311+\mathrm{G}$ (d, p). The time-dependent TD-SCF method used to get UV-Visible spectrum, HOMO-LUMO energy gap, in gas, DMSO, and chloroform phases with $6-311+G(d, p)$ basis set. In the same way NMR chemical shift, NBO, Mulliken charges, NLO properties are also computed.

## OUTCOMES AND DISCUSSION

## Conformational Structure Investigation

So as to achieve minimum energy arrangement of molecule 215P4O, the potential energy surface (PES) scan was done for 2I5P4O using Semi empirical AM1 method. The total energy of atoms as a function of C2-C3-C21-C13 and C2-C3-C12- O16 dihedral angles was taken for rotation. The dihedral angle was rotated in steps of 10 each step with $36^{\circ}$. For this rotation three global minimum positions have been obtained at $0^{\circ}, 180^{\circ}$ and $360^{\circ}$ for C2-C3-C12- O16 shown in the Fig. 1 (a) which clearly reveals that these three positions corresponds to the global minimum energy ( -0.0146 ) position. The rotational energise are presented in Table 1(a). For C2-C3-C21-C13 dihedral rotation, the minimum energy positions were obtained for $36^{\circ}$ and $216^{\circ}$ with energy of -0.0145 and -0.0146 . The structure obtained for global minimum energy of -0.0146 is used for other calculations.

## Structural Analysis

The optimized geometrical parameters like lengths and angles between the atoms are calculated by HF and B3LYP method with $6-311+G(d, p)$ basis sets. The calculated and experimental values are presented in Table 1(b).The optimised geometrical structure of the title compound 215 P 4 O is shown in the Fig 1(b). All the Carbon-Carbon bond lengths are $1.38 \AA$ in HF and $1.39 \AA$ in B3LYP; these demonstrations give no differentiation among the
single and double bond inside the ring. This is due to the overlapping of p-orbitals. Where as in CN bonds, two single bonds and one double bond with values $1.37,1.40$ and $1.25 \AA$ respectively. On comparing the results of HF and B3LYP, HF results are somewhat fewer than B3LYP. In the substitution group CC bond length is greater than other CC bond lengths. For C12-C13 and C3C12 have bond length about $1.53 \AA$ because these carbons are connected with oxygen. All the CH bond lengths are nearly in $1.08 \AA$.

${ }^{\text {ax }}$-ray data taken from Reference [Ian Sean Campbell, Kate L. Edler, Raleigh W. Parrott II, Shawn R. Hitchcock and Gregory M. Ferrence*ActaCrystallographica Section EMarch 2010]

Usually benzene ring has the hexagonal shape it has the bond angle of $120^{\circ}$. Here the benzene ring is substituted with imnooxazolidinone; due to this substitution the bond angle is lowered $1^{\circ}$ from the hexagonal angle. Imnooxazolidinone has pentagon shape; it has the different bond angle varying from $104^{\circ}$ to $131^{\circ}$. This variation is observed due to the substitution of amine and carboxylic groups. The calculated bond length and angles are compared with available x-ray data.

## VIBRATIONAL ASSIGNMENTS

The molecule under study 2I5P4O has 21 atoms so it has 57 fundamental modes of vibrations and belongs to CS point group symmetry. These 57 normal modes are distributed as

$$
\Gamma \mathrm{Vib}=39 \mathrm{~A}^{\prime}+18 \mathrm{~A}^{\prime \prime}
$$

A' represents the in the plane vibration and A" represents out plane vibration. All these fundamental modes of vibration are active in both IR and Raman spectra. The experimental and computed frequency by means of HF and B3LYP methods with 6-311+G(d,p), basis sets are reported in the Table 2. For graphical comparison, the experimental and computed spectra are shown in the Fig $2 \& 3$ for FT-IR and FT-Raman respectively.

## $\mathbf{C}-\mathbf{H}$ Vibrations

The expected region for aromatic $\mathrm{C}-\mathrm{H}$ elongating vibrations lies between $3000-3100 \mathrm{~cm}^{-1}[5-7]$, which is the area for identification of $\mathrm{C}-\mathrm{H}$ elongating vibrations in aromatic benzene derivatives. The compound 215P4O have six bands detected at $3100,3050,3030,2960,2950$ and $2800 \mathrm{~cm}^{-1}$ are
allotted to C-H elongating vibrations. The last three bands is found to be in the lower range. Among the three the first two bands from the aromatic C-H elongation, the last band at $2800 \mathrm{~cm}^{-1}$ is owing to the stretching of C-H present in the substitution of Iminooxazolidinone. From the observations the stretching of C-H is disturbed by the substitution.

Typically, the strongest absorptions for $\mathrm{C}-\mathrm{H}$ in-plane and out-plane bending of aromatic compounds happen in the region 1300-1000 $\mathrm{cm}^{-1}$ and 1000-675 cm ${ }^{-1}$ respectively [8-12]. In the present situation, the in-plane bending vibrations of $\mathrm{C}-\mathrm{H}$ are found at 1040, 1030, 1020, 1000, 980 and $940 \mathrm{~cm}^{-1}$ in FT-IR and FT-Raman. Almost all the C-Hin-plane bending vibrations are found to be in the expected region except last two bands. This indicates that the two $\mathrm{C}-\mathrm{H}$ in- plane bending vibration corresponds to Oxazolidinone group. The out-plane bending vibrations are observed at $630,620,610,540,530$ and $500 \mathrm{~cm}^{-1}$. The out-plane bending vibration of $\mathrm{C}-\mathrm{H}$ is likewise affected by the surrounding atoms which lie lower than the characteristic region.

## Carbon-Carbonmodes

The elongating vibrations insidering are significant in benzene and its derivatives are extremely representative of the aromatic compound. The aromatic Carbon double and single bond elongating modes frequently happen in the range 1400-1625 $\mathrm{cm}^{-1}$ [8],predominantly the bands among the range $1590-1650 \mathrm{~cm}^{-1}[13]$ and $1590-1430 \mathrm{~cm}^{-1}[14,15]$. In the current study, the $\mathrm{C}=\mathrm{C}$ stretching vibrations are detected at 1660,1560 and $1480 \mathrm{~cm}^{-1}$ with very strong intensity. The corresponding C-C stretching vibrations are found at $1480,1390,13601290$ and $1240 \mathrm{~cm}^{-1}$ with very strong intensity, which is beneath the predictable range. From these observations it is unblemished that the stretching vibrations inside the ring are disturbed greatly by the $\mathrm{NH}_{2}$ and $\mathrm{O}_{2}$ group. The Carbon-CarbonCarbon in out plane bending modes is appeared at 230,150 and $140 \mathrm{~cm}^{-1}$ and $100,95,60$, and 50 $\mathrm{cm}^{-1}$ correspondingly. Entirely the assignments connected to in-plane and out-plane ring bending mode are in coherent with the literature values [8-10].

## Carbon-Nitrogen Modes

Usually, CN vibration assorted with other modes; hence it is very tricky to recognize CN vibration. Most of the ring $\mathrm{C}-\mathrm{H}$ bending modes are mixed with CN modes. But in this current study, the CN stretching vibration is recognized undoubtedly with medium intensity at $1700 \mathrm{~cm}^{-1}$ in FTIR and $1670 \mathrm{~cm}^{-1}$ in FT-Raman allotted to Carbon Nitrogen double bond stretching and 1200 and $1140 \mathrm{~cm}^{-1}$ in infrared region are allotted to CarbonNitrogen single bond stretching modes. The in-plane and out-plane bending vibration of CarbonNitrogen double bond is observed at 910 and $490 \mathrm{~cm}^{-1}$ and CarbonNitrogen single bond are observed at 780,770 and, $300,270 \mathrm{~cm}^{-1}$ respectively. This observation is supported by the literatures[10]. According to the CN vibrations, there is no interference of other modes of vibrations and also they are in expected range.

## Nitrogen Hydrogen Modes

The NH stretching vibration detected in the range $3300-3500 \mathrm{~cm}^{-1}$ for all the primary aromatic amines[16]. The molecule under examination has two $\mathrm{NH}_{2}$ group in substitution. The NH stretching is perceived at 3300 and $3200 \mathrm{~cm}^{-1}$ these assignment correlate well with the earlier reports [17]. NHInPlane bending is occurs in $1095,1090 \mathrm{~cm}^{-1}$ and the Out-Plane NH bending vibrations are observed at $700,670 \mathrm{~cm}^{-1}$. The whole N-H vibrations seemed within the prescribed region of the spectra. This interpretation indicates the leading character of the amine group.

## Carbon Oxygen Modes

The pi bond among carbon and oxygen is responsible for carbon-oxygen double bond. The oxygen loan pair concludes the type of carbonyl group present. A strong absorption in the region 1740-1660 $\mathrm{cm}^{-1}$ conform the presence of carboxylic acid[7]. The ketonic CO stretching bands are significantly less intense than acid. The
typical $\mathrm{C}=\mathrm{O}$ stretching frequency in the current study seems at $1720 \mathrm{~cm}^{-1}$ in FTIR and FT-Raman with feeble intensity. This observation shows that the wave number well within the expected range; also the intensity is not high as expected. The inplane and the out-of-plane bending vibrations of CO are found at 930 and $450 \mathrm{~cm}^{-1}$ respectively. All these values clearly indicate that $\mathrm{C}=\mathrm{O}$ modes are not usually get affected by the other functional group, particularly CN or CC . The stretching C-O vibrations are found at $1230,1220 \mathrm{~cm}^{-1}$ and the in plane bending vibrations are at $890,870 \mathrm{~cm}^{-1}$. The out of plane bending vibrations are found at 410 and $320 \mathrm{~cm}^{-1}$.

## FMO Analysis

The FMO (Frontier Molecular Orbitals) comprise of the highest occupied molecular orbitals (HOMO) and the lowest unoccupied molecular orbitals (LUMO). The Frontier Molecular Orbitals shows a significant part in the optical and electric properties of molecule, as well as in UV-VIS absorption spectra[18]. The HOMO is the electron donor LUMO is an electron acceptor. The energy gap of HOMO-LUMO determines chemical hardness, softness, reactivity, stability and optical polarizability of a molecule [19, 20]. In order to estimate the energetic activities of the 215P4O, quantum computational calculations were carried out in DMSO, chloroform and gasusing B3LYP/6$311+\mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set and are presented in Fig 4.

fig 4 : Molecular Orbitals of 2-imino-5-phenyl-4-oxazolidinone

The computed energy value of HOMO is -7.2727 eVin DMSO, -7.2513 eV in chloroform, and -7.279 eV in gas phase. The computed energy value of LUMO is -1.6324 eV in DMSO, -1.6234 eV in Chloroform, and -1.620 eV in gas phase. The HOMO-LUMO energy gap is 5.640, 5.627, and 5.659 eV in DMSO, Chloroform and gas, respectively which are presented in Table 3. The HOMO-LUMO energy gap elucidates the ultimate charge transfer occurs inside the molecule, which is key factor to influence the organic activity of
the molecule. Additionally, the declining value of the energy gap from the gas phase to solvent, expresses the molecular stability. Computed 3D plots at B3LYP/6311+G(d,p) level in gas phase for 2I5P4O are illustrated in Fig 4. This electronic absorption primarily pronounced by an electron excited to LUMO from HOMO, which resembles to the transition to first excited state from the ground state. Thus higher the value of HOMOLUMO energy gap is basically a consequence of the small stabilization of LUMO.

Table 3: Computed Energy Values of 2- Imino 5-phenyl 4-oxazolidinonein different phase

| TD-DFT/B3LYP/ <br> $\mathbf{6 - 3 1 1 + G ( d , p )}$ | DMSO | Chloroform | Gas |
| :--- | :---: | :---: | :---: |
| Etotal (Hartree) | -607.901 | -607.902 | -604.266 |
| EHOMO (eV) | -7.272 | -7.251 | -7.279 |
| ELUMO (eV) | -1.632 | -1.623 | -1.620 |
| $\Delta$ EHOMO-LUMO gap (eV) | 5.64 | 5.63 | 5.65 |
| Chemical hardness $\eta(\mathrm{eV})$ | 2.82 | 2.81 | 2.82 |
| Electronegativity $\chi(\mathrm{eV})$ | 4.45 | 4.43 | 4.49 |
| Chemical Softness $\xi(\mathrm{eV})$ | 11.28 | 11.25 | 11.32 |
| Electrophilicityindex $\omega(\mathrm{eV})$ | 3.52 | 3.49 | 3.57 |
| Dipole moment $($ Debye $)$ | 1.1699 | 1.1012 | 0.9557 |

One of the vital electronic properties of the compound is dipole moment, if the molecule having high amount of dipole moment it will have very strong intermolecular interactions. From the Table 3 the computed dipole moment values increase from gas phase ( 0.9557 debye) to solvent phases (1.1012 in chloroform and 1.1699 in DMSO). The chemical hardness, softness, electronegativity and electrophilicity index are presented in Table 3.

## ELECTROSTATIC POTENTIAL MAP ANALYSIS

The ultimate extensive usage of computed molecular electrostatic potentials has been in relation to reactive behaviour. Molecular electrostatic potentials have been extensively used in biochemistry and pharmacology to recognize
specific patterns of positive and negative potentials that either stimulate or prevent specific natures of biological activities. Nucleophilic region of each molecule would interact favourably with the regions of most positive electrostatic potential on the other, exclusively the surface indigenous maxima. The 3D plots of molecular electrostatic potential (MEP) of 2I5P4O is illustrated in Fig 5. In MEP, negative region represented as red colour which is favoured location for electrophilic attack, the positive region represented as green colour which favoured site for nucleophilic attack. The significance of MEP is the fact that it concurrently displays molecular properties in relations of colour code, and is most valuable parameter in investigation of molecular dynamics with its physical and chemical property [21-24]. The various electrostatic potential surface are represented by various colours, potential
decreases in the order blue $>$ green $>$ yellow $>$ orange $>$ red. The colour code of for 2I5P4O maps is in the range between $-0.02731 \mathrm{a} . \mathrm{u}$. (deep red) to 0.02731 a.u. (deep blue). In 2 I5P4O molecule electrophilic attack prone to the region around the atoms O19 and N17 and the nucleophilic attack prone to region around H18 and H20. The neutral regions are found around the benzene ring.

## UV-VISIBLE SPECTRAL ANALYSIS

The time dependent self-consistence field (TDSCF) calculations are performed for 2I5P4O using B3LYP method with $6-311+\mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set, to understand electronic transitions. The computed excitation energies with absorption wavelengths corresponding oscillator strengths and dipole moments are specified in Table 4. The strong transitions observed at 271.32, 268.68 and 267.15 nm with an oscillator strength $0.0172,0.0073$ and 0.066 in gas, chloroform and in DMSO phase respectively are allotted to $\pi-\pi^{*}$ transition. The other calculated counterparts are tabulated in Table 4. The stimulated UV-Visible absorption band for 215P4O is revealed in Fig 6.

## MULLIKEN CHARGE DISTRIBUTION

The distribution of Mulliken charge is the important parameters of the molecule and it stipulates how the electronic assembly varies in atomic movement, so it is directly connected to the type of chemical bonds existing in the molecule. It influences electronic structure of the molecular system by affecting the dipole moment, Polarizability, etc., In Table 5 Mulliken charge distribution of 215 P 4 O molecule is calculated using HF and B3LYP level's with same basis sets are tabulated in Table 5. Comparative illustrations of charges distribution on each atom are exposed in Figure 7.

Among the carbon atoms,C13, C14 and C3are positive than the other carbon atoms. In the case of C14; two methods have predicted contrary results and C3 is most positively charged. In C3 position the substitutional group attached which is the reason for its high positivity of atom C3Among the negative carbon atoms, C2, C5 and C12 are comparatively more negative than the other atoms. Among the hydrogen atoms, H18, H20, H21 are more positive than other atoms. Among these hydrogen atoms H20 has highest value, which is connected with Nitrogen atom.

fig 7: Graphical Illustrations of Charges Distribution of 2-imino-5-phenyl 4-oxazolidinone

## NON -LINEAR OPTICAL STUDIES

Non Linear Optic (NLO) parameters the polarizability and first order hyperpolarizability of the 215 P 4 O compound were computed using the B3LYP method with $6-311+G(d, p)$ basis set to investigate the relationships among molecular structures.

The $\alpha x x, \alpha x y, \alpha y y, \alpha x z, \alpha y z, \alpha z z$ and $\beta x x x$, $\beta x x y, \beta x y y, \beta y y y, \beta x x z, \beta x y z, \beta y y z, \beta x z z, \beta y z z$, $\beta z z z$ are tensors related to polarizability and
hyperpolarizability. They acquired from frequency output file of Gaussian. The $\alpha$ and $\beta$ values has been converted into electro static units (esu), they are in atomic unit (a.u). The total dipole moment $(\mu)$ of molecule, linear polarizability $(\alpha)$ and firstorder hyperpolarizability $(\beta)$ have been explained in detail previous studies $[25,26]$ and Density Functional Theory has been comprehensively used as technique to examine the organic NLO properties of the materials [27-31].

$$
\begin{gathered}
\alpha_{\mathrm{tot}}=\frac{1}{3}\left(\alpha_{x x}+\alpha_{y y}+\alpha_{z z}\right) \\
\langle\beta\rangle=\left[\left(\beta_{x x x}+\beta_{x y y}+\beta_{\mathrm{xzz}}\right)^{2}+\left(\beta_{y y y}+\beta_{y z z}+\beta_{y x x}\right)^{2}+\left(\beta_{z z z}+\beta_{z x x}+\beta_{z y y}\right)^{2}\right]^{\frac{1}{2}} \\
\mu_{\mathrm{tot}}=\left(\mu_{x}^{2}+\mu_{y}^{2}+\mu_{z}^{2}\right)
\end{gathered}
$$

The NLO properties of the molecule depend on the value of dipole moment, molecular polarizability and first hyper polarizability. In Table 6, the calculated polarizability and hyper polarizability and the electronic dipole moment $\mu_{x}, \mu_{y}, \mu_{z}$ and total dipole moment for 2I5P4O are listed. The $\mu_{\text {tot }}$ is measured using $\mu_{\mathrm{x}}, \mu_{\mathrm{y}}, \mu_{\mathrm{z}}$ [32]. From the table, it has been found that polarizability and hyperpolarizability and dipole moment of the 2I5P4Oare active. So that 2I5P4Ocan be used to make NLO materials.

Table 6: NLO Parameters of 2-Imino-5-phenyl-
4-oxazolidinone

| Parameter | a.u. | Parameter | a.u. |
| :---: | :---: | :---: | ---: |
| $\alpha_{x x}$ | -60.9836 | $\beta_{x x x}$ | -30.6564 |
| $\alpha_{y y}$ | -10.6163 | $\beta_{y y y}$ | -13.9614 |
| $\alpha_{z z}$ | -2.9038 | $\beta_{z z z}$ | 1.6249 |
| $\alpha_{x y}$ | -4.9883 | $\beta_{x y y}$ | 19.9622 |
| $\alpha_{y z}$ | 6.3783 | $\beta_{x x y}$ | 24.0561 |

| $\mu_{t o t}$ | 0.9556 |  |  |

## THERMODYNAMIC PROPERTIES

The values of thermodynamical factors like zero point vibrational energy etc., of 2I5P4O at 298.15 K in lower energy state are tabulated in Table 7. The significant difference in Zero-Point

Vibrational Energies (ZPVEs) found. The HF method shows higher ZPVE than DFT/B3LYP method. The highest value of ZPVE of 215P4O is 453600.2 joule mol-1 computed by HF/6-311++G (d,p) while the lowest value is 421428.7 joule mol-1 computed by B3LYP/6-311++G(d,p).

Table 7: The computed Thermodynamical Properties of 2- Imino 5-phenyl 4-oxazolidinone Molecule at 298.15K

| Thermodynamical <br> Factors | DFT | HF |
| :---: | :---: | :---: |
| SCF Energy | -607.90158(a.u) | -604.26658(a.u) |
| ZPVE (joule $\mathrm{mol}^{-1}$ ) | 421428.7(joule $\mathrm{mol}^{-1}$ ) | 453600.2(joule $\mathrm{mol}^{-1}$ ) |
| Rotational Constants A | $1.65176(\mathrm{GHz})$ | $1.68706(\mathrm{GHz})$ |
| Rotational Constants B | $0.56131(\mathrm{GHz})$ | $0.56923(\mathrm{GHz})$ |
| Rotational Constants C | 0.45083(GHz) | $0.45765(\mathrm{GHz})$ |
| Specific heat capacity ( $\mathrm{C}_{\mathrm{v}}$ ) | 39.822( $\mathrm{cal} \mathrm{mol}^{-1} \mathrm{~K}^{-1}$ ) | $36.525\left(\mathrm{cal} \mathrm{mol}^{-1} \mathrm{~K}^{-1}\right)$ |
| Entropy (S) | 102.175(calorie mole ${ }^{-1} \mathrm{~K}^{-1}$ ) | 99.785(calorie mole ${ }^{-1} \mathrm{~K}^{-1}$ ) |
| Dipole Moment | 1.3593(Debye) | 1.3822(Debye) |
| Enthalpy (KCal/Mol) | 107.167 | 114.438 |

Dipole moment replicates the charge distribution in a molecule and is assumed as a vector quantity. Consequently, it is the significant factor to demonstration of charge drive through the molecule. The centre of positive and negative charge decides the position of the dipole moment vector in a molecule. The result obtained from HF and DFT computation shows lowest dipolemoment was observed for DFT than HFfor 2I5P4O. Based on vibration, the statistical thermodynamic functions like heat capacity (C), entropy (S), and enthalpy changes $(\Delta \mathrm{H})$ for 2 I 5 P 4 O were computed and tabulated in Table 8. From the Table 8, it can be observed that these functions are increasing with increase in temperature in steps of 50 K upto 250
K. This is due to the molecular vibration increase with temperature [33]. The relationships between thermodynamic functions are fitted by quadratic equations.

$$
\mathrm{C}=5.2446+0.07596 \mathrm{~T}-1.65886 \times 10-4 \mathrm{~T} 2
$$

$$
(\mathrm{R} 2=0.9999)
$$

$\mathrm{S}=51.0506+0.2057 \mathrm{~T}-1.66514 \times 10-4 \mathrm{~T} 2$
( $\mathrm{R} 2=0.9995$ )
$\mathrm{H}=99.3134+0.0026 \mathrm{~T}-6.05714 \times 10-5 \mathrm{~T} 2$
( $\mathrm{R} 2=0.9998$ )
The comparable fitting factors (R2) are 0.9999 , 0.9995 and 0.9998 . The graphical relationships are shows in Fig. 8.

Table 8: Thermodynamic Propertiesof 2-Imino-5-phenyl-4-oxazolidinone at Various Temperatures T(K)

| Temperature <br> (kelvin) | Heat Capacity <br> ${\text { (calorie } \text { mole }^{-1} \mathbf{K}^{\mathbf{- 1}} \text { ) }}$ | Entropy <br> (calorie mole $^{\mathbf{1}} \mathbf{K}^{\mathbf{- 1}}$ ) | Enthalpy Change <br> (kcalorie mole $^{\mathbf{- 1}}$ ) |
| :---: | :---: | :---: | :---: |

fig :8 Thermo Dynamical Properties of 2-imino-5-phenyl 4-oxazolidinone

This thermodynamic relation gives valuable information for the additional study on the2I5P4O. Affording to the second law of thermodynamics these thermodynamic relations, estimate directions of chemical reactions in thermo chemical field. And they can also be used to compute the other thermodynamic energies. Entropy (S), Enthalpy changes $(\Delta \mathrm{H})$ and Heat capacity $(\mathrm{C})$ are increased with respect to temperature is shown in the Fig. 8 . Hence in the form of vibrational energy the 2I5P4O is capable of storing the kinetic energy

## NMR SHIFT EXAMINATION

The proton i.e. hydrogen $H$ and Carbon13 chemical shift of the title molecule were performed with different solvents like DMSO, ETHANOL, METHANOL and GAS phase by B3LYP/6$311+G(d, p)$ method. The experimental proton and carbon 13 NMR spectrum of the compound 2I5P4O is shown in Fig 9 and 10. Corresponding proton and carbon 13 NMR values for 2 I 5 P 4 O are given in Table 9. Chemical shifts were calculated in parts per million ( ppm ) compare to Trimethylsilane
(TMS) for proton and carbon 13 NMR spectra. Affording to results obtained is in correlation with the experimental outcomes.

The maximum chemical shift is observed for the Carbon atom at 13 positions which is attached to the oxygen atom has shift of 202.631 ppm in solvent phase and 174.4 ppm for gas phase. C14 also have the maximum value 179.679 ppm
which is connected with electronegative nitrogen and oxygen atoms. The minimum chemical shift is observed at C 12 is attached to oxygen with single bond having the chemical shift of 89.5438 ppm . The remaining carbon atoms are having the chemical shift values around 130 to 140 ppm .

Table 9: Computed and Experimental NMR Shift (1H and 13C NMR) of2- Imino 5-phenyl 4-oxazolidinone

| Atom | Observed <br> Chemical Shift | Computed chemical Shift (ppm) <br> B3LYP/6-311+G(2d,p) |  |  |  |

Among the hydrogen atoms H 18 is 8.5449 ppm which is attached to nitrogen atom (N17) so the shift is large. The lowest value is obtained for 21 H and 20 H as $5.3617 \& 6.3797 \mathrm{ppm}$ respectively
because of the attachment of C-O \& C-N. The remaining hydrogen atoms have the values from 7.56 to 7.888 ppm .

## NATURAL BOND ORBITAL STUDY

To explain charge transfer and orbital interaction among the bonds in a molecular system natural bond analysis is required. From earlier report [34,35], orbitals of electron donor and acceptor and their interrelating energies are obtained by the second order perturbation theory of Fock matrix. The larger the value of stabilization energy, the more intensive is the interaction between electron donors and acceptor levels. The Lewis type bonding orbital and Non-Lewis type antibonding orbital resemble to donor-acceptor stabilization interaction due the delocalization of electron density between them.

The various conceivable donor and acceptor orbitals, bond types and their occupancy value for 2I5P4O are presented in Table 10. The probability of transitions indicates the stabilisation energy E2 values of different transitions. Affording to energy valuesE(2) the subsequent transitions are most possible; 1.C1-C6 $\rightarrow$ C2-C3 gives $20.78 \mathrm{Kcal} /$ mol, $\left(\pi-\pi^{*}\right), 2 . \mathrm{C} 2-\mathrm{C} 3 \rightarrow \mathrm{C} 4-\mathrm{C} 5$ gives $20.08 \mathrm{Kcal} /$ mol, $\left(\pi-\pi^{*}\right), 3 . \mathrm{C} 4-\mathrm{C} 5 \rightarrow \mathrm{C} 2-\mathrm{C} 3$ gives $21.18 \mathrm{Kcal} /$ mol, $\left(\pi-\pi^{*}\right)$. 4.Lone Pair N15 $\rightarrow$ C13-O19 (23.17 $\left.\mathrm{Kcal} / \mathrm{mol}, \mathrm{n}-\sigma^{*}\right)$ 5.Lone Pair O19 $\rightarrow$ C13-N15 ( $25.07 \mathrm{Kcal} / \mathrm{mol}, \mathrm{n}-\pi^{*}$ type).

## CONCLUSION

Structural parameters of the 215 P 4 O is analysed using HF and B3LYP methods with $6-311+\mathrm{G}$ $(\mathrm{d}, \mathrm{p})$ basis sets. The CC bonds around phenyl ring are same. The other C-C bond lengths in substitution are different and also is higher than that the ring CC. A complete vibrational study of the title molecule is performed and also proper assignments were made. From the assignments it is found that Carbon-Hydrogen stretching and bending modes are altered by the substitution. Nitrogen-Hydrogen stretching vibrations are not altered by other modes. The very small difference observed between experimental and calculated wave numbers. Therefore, the outcomes obtained for 2I5P4O indicates that B3LYP methods is trustworthy for the prediction of both infrared and Raman spectra.

Theoretically computed entropy, heat capacity and enthalpy for 215 P 4 O are increasing with increase in temperature. This is due to the molecular vibration increases with increase in temperature. So as to understand electronic transitions for 215P4O, TD-SCF calculations performed in gas and solvent (DMSO and chloroform) phase. The electronic spectrum corresponds to the $\pi-\pi^{*}$ transition. NBO analysis is also done for the title molecule which is used predict the charge transferring occurs between bonding and antibonding orbitals. NMR chemical shift were computed and compared with experimental chemical shift. Using MEP, the reactive site of the molecule was predicted. NLO property of the title molecule also analysed. The outcomes of this investigation aid researchers to make additional investigation and synthesis of new compound.
